

Appendix: 23**PROTOCOL TITLE: Childbirth Procedure****REVISED: October 15, 2014**

INDICATIONS: Active labor with crowning confirmed by visual inspection.**PROCEDURE:**

1. Delivery should be controlled so as to allow a slow, controlled delivery of the infant. This will prevent injury to the mother and infant.
2. Consider additional resources as there will be two potential patients.
3. Don mask, gloves, gown, eye protection.
4. Create a clean field around the vaginal opening with clean towels.
5. Prepare for delivery:
 - Have the mother lie in a modified semi-Fowler's or Trendelenburg position (knees drawn up and spread apart)
 - Elevate buttocks – with blankets or pillows.
 - The floor is actually recommended over bed for delivery
 - If an alternate position is preferred, then attempt to accommodate the mother
6. Support the infant's head as it delivers. Apply gentle palmar counter-pressure to the head to prevent an explosive delivery.
7. If the umbilical cord is around the neck, attempt to slip it over the head. If unable to free cord from the neck, double clamp the cord (about 2 inches apart) and cut between the clamps.
8. Suction the airway (mouth and nostrils) with a bulb syringe after the head has delivered.
9. While continuing to support the head, gently lower the head to encourage delivery of the anterior shoulder.
10. Once the anterior (upper) shoulder delivers gently lift the head and anterior shoulder to allow delivery of the posterior shoulder.
11. Support the infant's body while delivering the remainder of the body. Keep the body at the level of or below the vagina so prevent loss of blood back to the placenta.
12. Clamp the cord at 6 inches and 9 inches from the neonate's abdomen and cut the cord between the clamps.
13. Vigorously dry the baby with clean, dry towels.
14. Record APGAR scores at 1 and 5 minutes.
15. Follow the **General Pediatric Care** protocol for further treatment.
16. The placenta will deliver spontaneously, usually within 5-25 minutes of the infant. Do not force the placenta to deliver or pull on the umbilical cord.
17. Massage the uterus and/or initiate breast feeding (as infant and/or maternal condition allows) to stimulate uterine contractions, decrease bleeding and initiate delivery of the placenta. If the placenta delivers, it should be retained for inspection. For post-partum hemorrhage refer to the **OB Emergencies** protocol.
18. Expedite transport following delivery of fetus. Do not delay transport for delivery of the placenta.

COMPLICATED DELIVERIES

- Code 3 transport to the closest appropriate (surgical capabilities) for ANY of the following complications

Prolapsed Cord: Condition where the cord presents through the birth canal before delivery of the head; presents a serious medical emergency which endangers the life of the unborn fetus.

- Place mother in knee-chest position
- Check cord for pulsation and rate
- Apply gentle pressure to presenting part and relieve pressure on the cord. Insert two fingers of gloved hand into vagina to raise the presenting part off the umbilical cord.
- Recheck cord for pulsation and rate. Keep cord moist and warm
- Administer high flow oxygen
- Rapid transport in this position with rapid notification of receiving facility

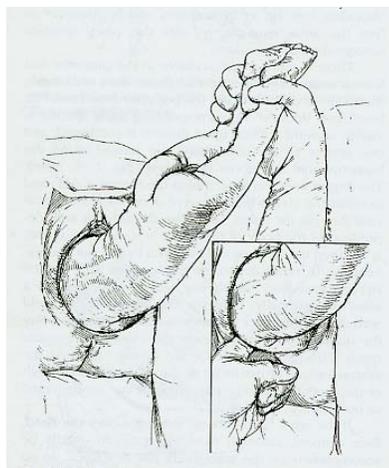

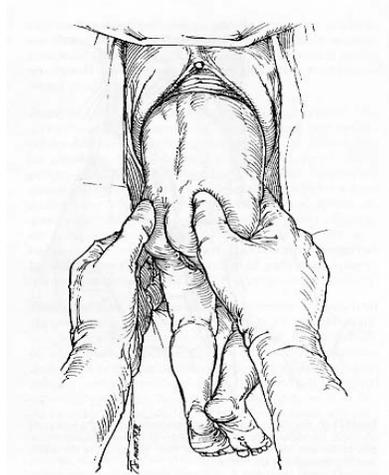

Cephalopelvic Disproportion: A condition where the babies head/body will not progress through the pelvis during delivery. Causes include large fetus, small or abnormally shaped pelvis, overdue deliveries and abnormal fetal positions.

- Immediate treatment is caesarian section
- Reposition the patient. Sometimes this will resolve the problem
- Press firmly on the Pubic Symphysis. This may open the birth canal further to allow passage of the head
-
- Rapid transport and notification of receiving facility

Breech/Limb Presentation: Breech presentation occurs when the buttocks or lower extremity are low in the uterus and will be the first part of the fetus delivered.

- Place mother in delivery position, elevate pelvis with pillows (Modified Trendelenburg)
- Administer high flow oxygen to mother
- See instructions/diagrams on following page

- Support the spontaneously presenting part until the back/umbilicus appear
 - When providing traction, grasp the iliac wings, don't pull on the legs, or apply pressure to the soft lower back
 - If possible, extract a 4-6 inch loop of umbilical cord for slack
 - Continue light downward traction until shoulder blades or arm pits appear
 - If head delivery is delayed, insert two fingers on each side of the infants nose to help maintain baby's airway
-
- Guide neonate up to deliver posterior shoulder first
 - Splint humerus to side of neonate's body and try to sweep arm out of birth canal
 - Now guide neonate down to deliver anterior shoulder.

- Have assistant provide gentle downward pressure on the uterus to help facilitate flexion of the head.
- Putting fingers around the mouth during delivery may prevent chin from hanging up.
- Gently swing the body upward to help permit delivery.
- Never try to pull the baby's head out during breech delivery
- If the head fails to deliver within 3 minutes, create a "V" with the fingers on either side of the nose to create an airway → Oxygen, IV, Monitor, Trendelenburg, Rapid transport.
